

# KITCHEN DESIGN

The kitchen was designed according to the allotted space that was given in the Tiny House. In order to have all materials, such as the countertop, cabinets and the refrigerator placed accurately and built with the most eco friendly materials the area was first measured with great detail. The advantages in the Tiny House kitchen over a regular kitchen include durability, aesthetically pleasing designs and environmentally friendly materials.

In the far left of the kitchen, there is a 20 inch space where the refrigerator is placed under the counter top. In total there are four counter top cabinets and the sink is under the center line of the window. The sink cabinet is 30 inches in width, leaving space between the sink and the stove. The stove is on the right side of the sink. The cabinet under the stove is two inches lower than the other cabinets due to the stove's height. The last cabinet on the far right is 12 inches in width; this cabinet was designed this way to keep the stove away from the wall. Also the fourth cabinet would be used as space to include extra drawers. The overall counter top in the Tiny House kitchen is 101 inches in length, two inches less than the original kitchen space.
